- WO 2005/066448

1 - Panel (3) for shutter formed by profiles (1) successively juxtaposed with the respective longitudinal axes defining a plane, profiles that are destined to be fixed, by any conventional means, in a frame containing that plane and provided with an interior face (11) and with an exterior face (12), all or at least some of them being additionally provided with transversal openings (101) that develop longitudinally along at least a portion of the length of said profiles, openings (101) that place the interior faces of the profiles in communication with the correspondent exterior faces characterised in that said profiles (1) are transversally slotted, from one side to the other, according to the referred plane or another one it, the slots (102)developing parallel to longitudinally along at least a portion of the length of the said profiles and in correspondence with the cited openings (101), in that the panel also comprises at least a plate (2) provided with openings (201) parallel between themselves and disposed in correspondence (total partial) with the said openings (101) existing in at least a portion of the length of the set of the respective profiles, plate(s) that is(are) introduced through the said slots (102) existing in that portion of the length of the profiles, and in that this (these) plate(s) (2) is (are) able to translate in the mentioned plane, through the referred correspondent slots (102) in order to assume at least two distinct positions, one position of correspondence between its openings (201) and the correspondent openings (101) of the profiles - allowing the passage of light and air - and another of lack (total or at least partial) correspondence between such openings - preventing, at least

partially, the passage of light and air through the said openings (101).

- 2 Panel according to claim 1, characterised in that
  5 the profiles (1) are tubular.
  - 3 Panel according to claim 2, characterised in that the profiles (1) have internal walls (13) that, together with the walls provided with the referred interior (11) and exterior (12) faces, define the tubular chambers; in that those internal walls are connected to the other walls not by the extremes of these, but from further back, allowing these to prolong on one of the sides by short edges and on the other side by longer edges; in that the openings (101) develop along the longer edges; in that the slots (102) develop along the referred internal walls; and in that those internal walls are substantially slopped, at least in the correspondent part comprised between the slot (102) and the exterior face (12).

- 4 Panel according to claim 3, characterised in that, between the longer edges of the profiles (1), are placed caps (4) provided with slots (41) for guidance of the plate (2), those caps being positioned in the vicinity of the tops of the openings (101).
- 5 Panel according to claim 1, characterised in that at least one of the profiles (1) is provided with a slot (103) that goes through the wall correspondent to the interior face (11), slot that is crossed by a

WO 2005/066448 PCT/IB2004/004285

- 12 -

cursor/limitation device that serves as handle (6) and is fixed on the plate (2), handle that, translating in said slot, proportions the translation movement of the plate, whose amplitude is limited by the extension of the slot (103).

5

10

6 - Panel according to claim 1, characterised in that the plate(s) (2) has (have), on each side, at least a recess (21) that cooperates with means of attachment (5) and allows to fix the plate (2) at least in one point of its translation movement.
